Financial and livelihood impacts of severe weather events on farming communities: Pretoria case study.

The overarching aim of this study is to understand the financial and livelihood impacts of severe weather events on farming communities, with a specific focus on the 2015-2016 South African drought, and the experiences of two smaller-scale farm categories: emerging small scale commercial farmers on communal land and medium scale commercial farmers on private land. The research was conducted in agricultural communities on the outskirts to the north of Pretoria (Tshwane), in Gauteng Province, South Africa.
